

The slide features a white background with several decorative elements. On the left, there are four hexagons: a light blue one, a dark green one, a large medium green one, and a small dark green one. On the right, there are overlapping blue geometric shapes, including triangles and polygons, creating a modern, abstract design.

Healthcare Analytics for Doctor Visits

Data Analytics DIY Project

**Abhishek Kumar
Tiwari**

PROBLEM STATEMENT

- Healthcare datasets contain multiple demographic and health-related variables. The project analyzes doctor-visit patterns and explores how gender, age, illness and health indicators relate to recorded visits.

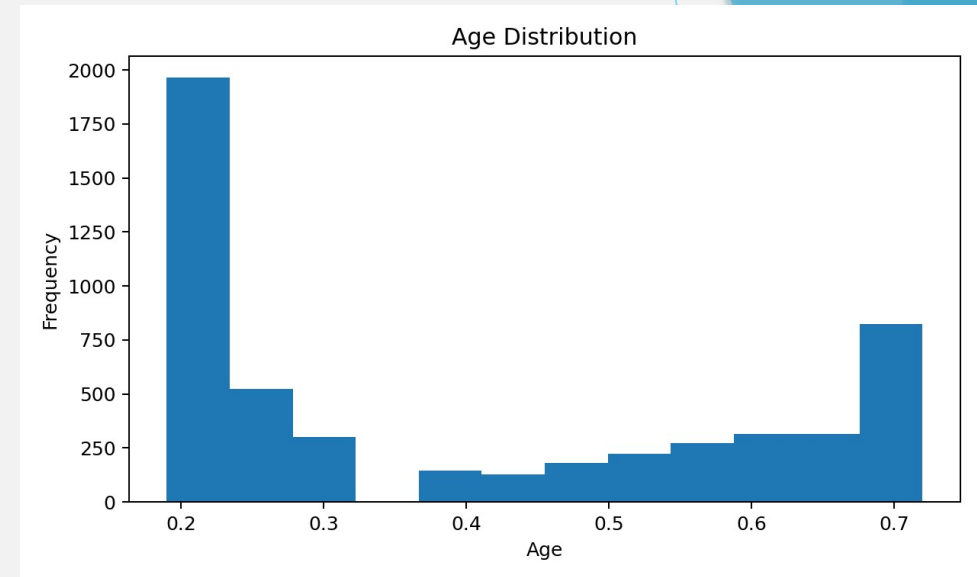

Project Description

Dataset: 5,190 records • 13 columns

Analysis: Doctor visits are examined using gender, age, income, illness, reduced activity, health, insurance and chronic-condition variables.

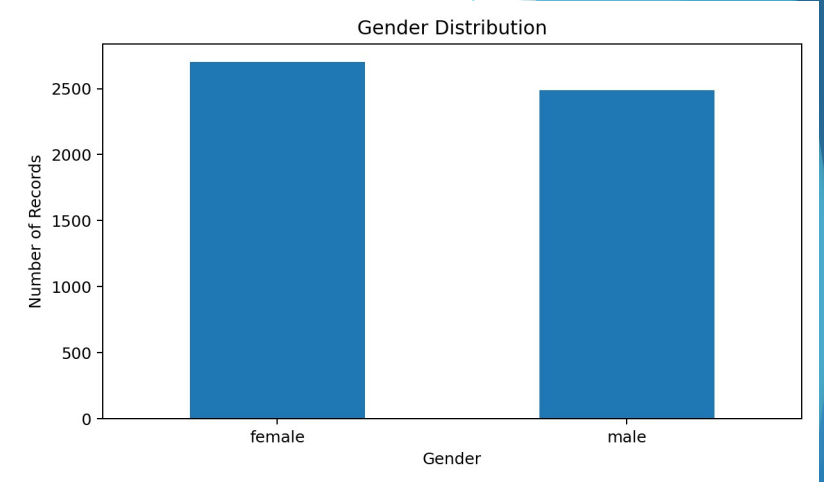

Workflow: Load data → inspect structure → descriptive statistics → missing-value check → univariate analysis → grouped analysis → multivariate visualization.

Goal: Identify useful patterns in recorded doctor visits and communicate them through simple, interpretable charts.

WHO ARE THE END USERS?

- • Healthcare administrators and clinic managers
- • Doctors and care teams reviewing visit patterns
- • Healthcare / public-health analysts
- • Data analysts building dashboards and reports

Technology Used

- • Python
- • Pandas – data loading, cleaning and aggregation
- • NumPy – numerical analysis
- • Matplotlib – visualization
- • Seaborn – statistical plots
- • Jupyter Notebook / Google Colab – analysis workflow

RESULTS & KEY FINDINGS

Records
5,190

Columns
13

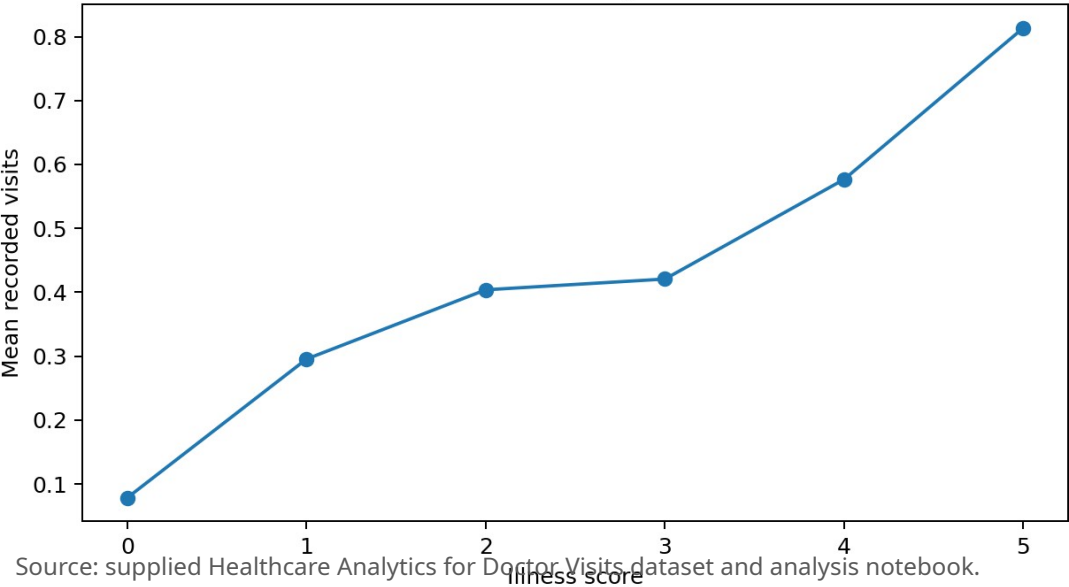

Avg. Visits
0.30

Max Visits
9

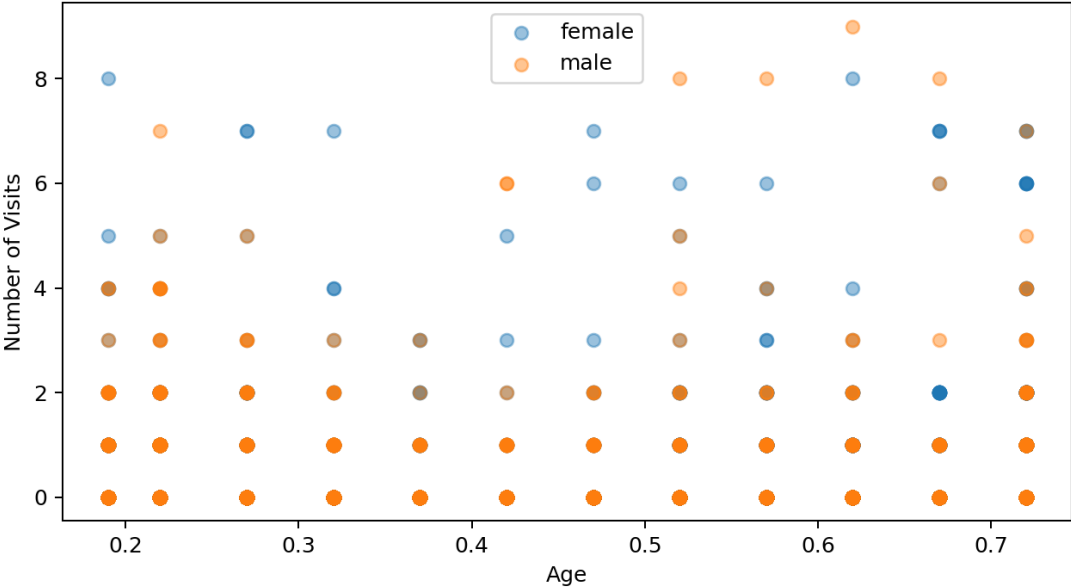

Key findings

- Female records: 2,702; male: 2,488.
- Average visits: 0.36 female vs 0.24 male.
- Mean visits rise from 0.08 at illness score 0 to 0.81 at score 5.
- 4,141 of 5,190 records report zero visits.

Illness Score vs. Average Doctor Visits

Age vs. Doctor Visits by Gender
